

Biomarkers Workshop

Discussion points:

- **There is a need for a large prospective longitudinal biomarker study with rigorous harmonization of sample collection, preparation and analysis. This study should include collection of blood, CSF, genomic, cognitive, EEG and brain imaging samples the analysis of which can be used to inform clinical trial design. Such a study should include evaluation of biomarkers characteristics such as variability, state vs trait, reproducibility and ease of use.**
- **ADNI can be a model for such an Early Psychosis Biomarker study. This will require a partnership of Industry, Academia, and NIH.**

Next steps: A survey will be sent to the workshop attendees to assess their personal interest in contributing to a biomarkers proposal and assessing their company 's interest for those is Pharma. Focus on Sample and Data collection and methods not hypotheses
