# Placebo Effects may Add Value

[Talk](#)

[Placebo Effects may  
Add Value](#)

[Overview](#)

[Meta-Analysis](#)

[Dropout Rates](#)

[2x2 Blind Trial](#)

[Value Added](#)

[Effects of Behavior,  
Treatment, and  
Interaction](#)

[Conclusion](#)

[Additional Slides](#)

- “Behavior” is often described as a “placebo”, and discounted from treatment
- Behavior can interact with treatment—part of the efficacy of treatment!

## Example

- Anti-depressant treatment: making new friends
- New treatment (drug): helps to reduce social anxiety
- In a trial:
  - Those who believe they are treated go to parties;
  - Those who don't, don't.
- Effect of drug is all through the interaction of a treatment (drug) with a behavior (going to parties)

[Placebo Effects may](#)

[Add Value](#)

[Overview](#)

[Meta-Analysis](#)

[Dropout Rates](#)

[2x2 Blind Trial](#)

[Value Added](#)

[Effects of Behavior,](#)

[Treatment, and](#)

[Interaction](#)

[Conclusion](#)

[Additional Slides](#)

- Most clinical trials with 50/50 treatment/control are underpowered
  - ~70% of two-armed trials on ClinicalTrials.gov use this protocol
- Two causes, likely to vary across treatment and participant population. Higher probability of treatment  $\Rightarrow$ 
  - lower dropout rate
  - stronger interaction of behavior and treatment $\Rightarrow$  more power
- $2 \times 2$  trials can uncover superior treatment probabilities
  - Can be used in Phase II
  - Produce a deeper understanding of the true value added of a treatment

[Dropout Rates](#)

[2x2 Blind Trial](#)

[Value Added](#)

[Effects of Behavior,](#)

[Treatment, and](#)

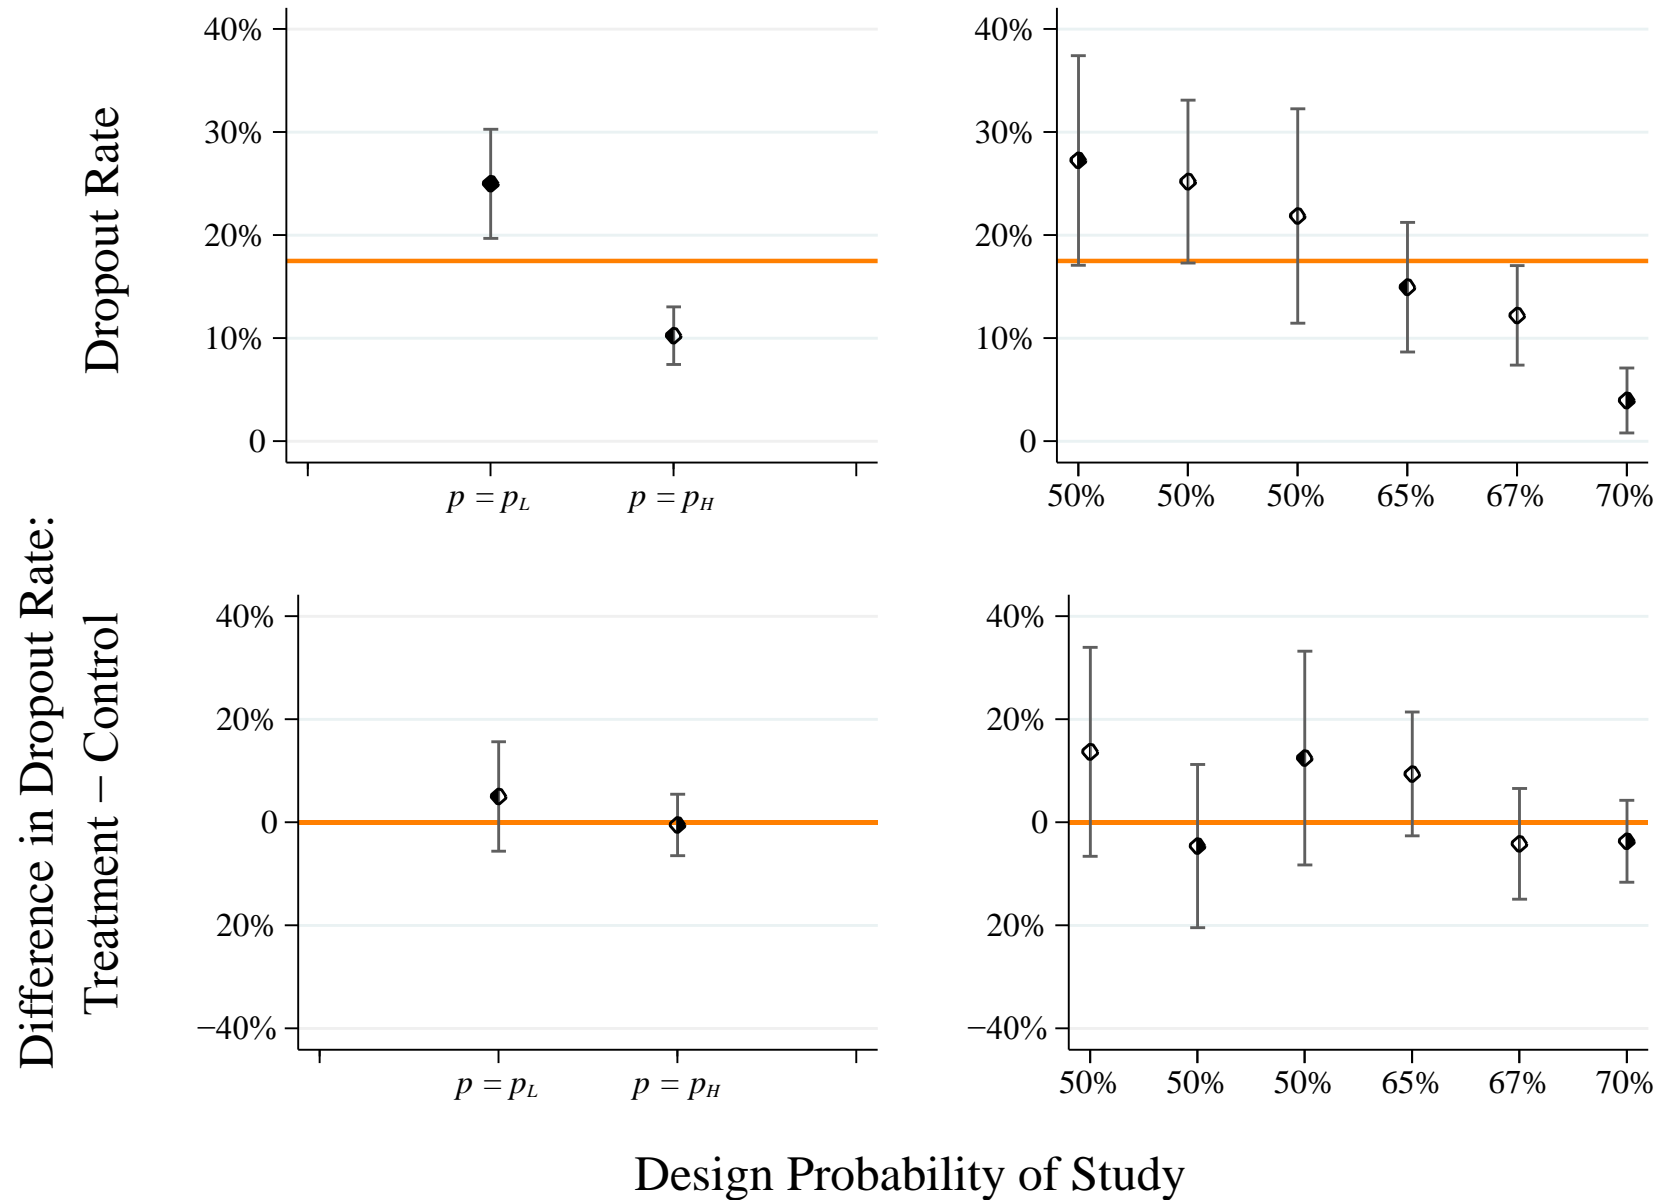

[Interaction](#)

[Conclusion](#)

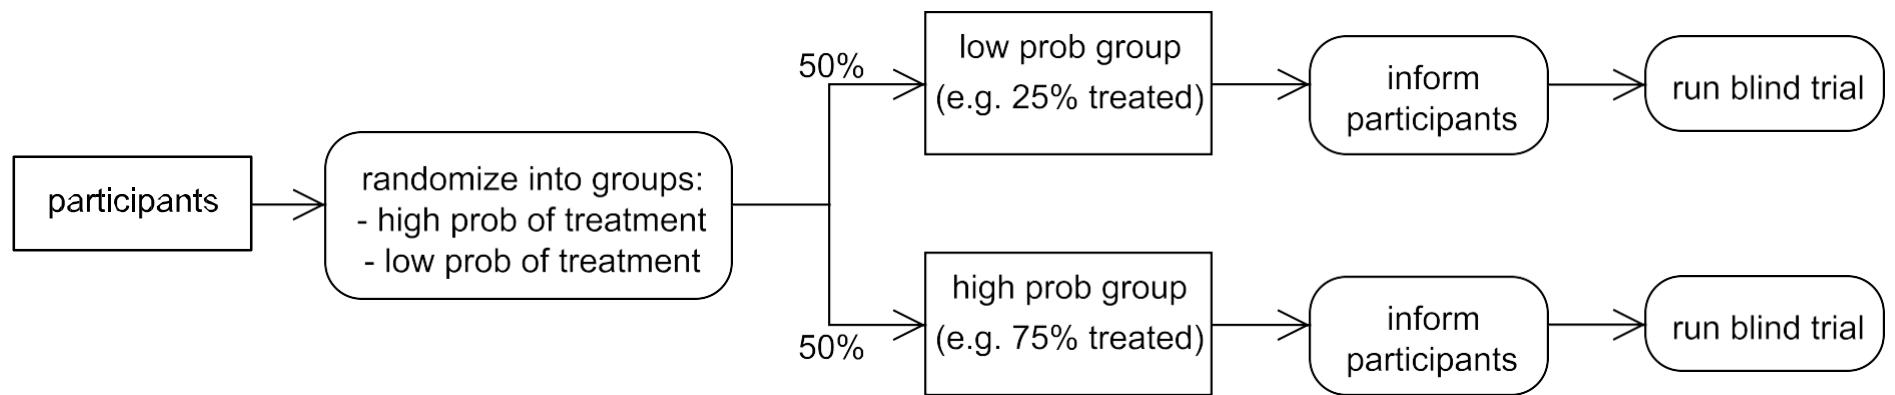

[Additional Slides](#)

- Chassang et al. (2015 PLOS ONE) analyzes every placebo controlled anti-depressant trial where patient-level data is available
  - Data from Fournier et. al. (2010)
- These trials have different probabilities of randomization:
  - Three for SSRI paroxetine:  $p = 0.5, 0.65, 0.67$
  - Three for TC imipramine:  $p = 0.5, 0.5, 0.7$

# Dropout Rates

# 2x2 Blind Trial

# Accounting for Behavior in Value Added

[Talk](#)

[Placebo Effects may](#)

[Add Value](#)

[Overview](#)

[Meta-Analysis](#)

[Dropout Rates](#)

[2x2 Blind Trial](#)

[Value Added](#)

[Effects of Behavior,](#)

[Treatment, and](#)

[Interaction](#)

[Conclusion](#)

[Additional Slides](#)

- Problem: Behavior is not randomly assigned
  - But, behavior responds the probability of treatment
    - Blinding is necessary or else treatment probability is 0 or 1
  - Randomization of probability of treatment randomizes behavior
    - Allows for identification of effect of behavior
  - Both treatment and behavior are randomized: allows for identification of interaction
- ⇒ provides a full accounting of value added

# Effects of Behavior, Treatment, and Interaction

[Placebo Effects may](#)

[Add Value](#)

[Overview](#)

[Meta-Analysis](#)

[Dropout Rates](#)

[2x2 Blind Trial](#)

[Value Added](#)

[Effects of Behavior,](#)

[Treatment, and](#)

[Interaction](#)

[Conclusion](#)

[Additional Slides](#)

- Effect of a new treatment might be enhanced by interactions with behavior (placebo)
- Higher probability of treatment may lead to lower dropout, stronger placebo effects
- Thus, 50/50 trials may be sub-optimally powered
- Two-by-two blind trial can identify when this is the case,
  - Can be run in Phase II, or in research

[Dropout](#)

[Outcomes](#)

[What Next?](#)

Dependent Variable:	HDRS reduction	
	SSRI	TC
Treatment	-1.32 (1.32)	2.94 <sup>***</sup> (1.16)
High Probability of Treatment	-0.98 (1.13)	5.09 <sup>***</sup> (1.32)
High Probability × Treatment	3.41 <sup>**</sup> (1.56)	-0.91 (1.74)
Constant	7.72 <sup>***</sup> (0.95)	7.04 <sup>***</sup> (0.76)
N	384	334

[Talk](#)

[Additional Slides](#)

[Dropout](#)

[Outcomes](#)

[What Next?](#)

- New approach to designing trials
- Analysis of data available to us suggests techniques may actually be useful

## What Next?

- NSF grant for more theory work: dynamic experiments, experiments with spill-overs
  - Some other funding for more lab studies
- Some additional funding for studies of technology adoption in developing countries
- Looking for collaborators: especially people involved in evaluating new drugs / weight loss / smoking cessation / etc.
